HEALTH 2020

A European policy framework supporting action across government and society for health and well-being
Health 2020: a European policy framework supporting action across government and society for health and well-being
Abstract

The 53 countries of the European Region approved a new value- and evidence-based health policy framework for the Region, Health 2020, at the session of the WHO Regional Committee for Europe in September 2012. Health 2020 focuses on improving health for all and reducing health inequalities, through improved leadership and governance for health. It focuses on today’s major health problems. It identifies four priority areas for policy action and is innovative in terms of responses across all levels and sectors of government and society, emphasizing developing assets and resilience within communities, empowerment and creating supportive environments. It details the strengthened roles of public health services and the health system. Health 2020 was approved in two forms: a European policy framework supporting action across government and society for health and well-being for politicians and those developing policy and the longer Health 2020 policy framework and strategy, which provides more operational detail. Implementing Health 2020 in countries is now the fundamental top-priority challenge for the Region.

Foreword

Health 2020: a European policy framework supporting action across government and society for health and well-being sets out a far-sighted and ambitious agenda for health. Agreement on this framework by all 53 Member States of the WHO European Region comes at a crucial time. As we approach 2015 and the deadline for achieving the Millennium Development Goals, this policy will help to position health in the next generation of global goals.

The framework crystallizes what we have learned about the role of health in recent years. Maximizing health through all stages of life is a fundamental right for all and not a privilege for a few. Good health is an asset and a source of economic and social stability. It is key to reducing poverty and both contributes to and benefits from sustainable development. Most important, good health can no longer be seen an outcome of one sector alone: sustainable and equitable improvements in health are the product of effective policy across all parts of government and collaborative efforts across all parts of society.

Readers will find that these insights lie at the heart of the strategy. The challenges to be addressed in the Region are considerable. Health inequities within and between countries reflect economic and social divisions across society. As economic pressures bite and health care costs rise, the risk of exclusion increases, too often leaving behind those with the greatest health needs. At the same time, we know that public expectations for the newest and the best in health technology in combination with the changing disease profile of ageing populations place huge pressure on budgets. New approaches and perspectives are needed if universal health coverage is to be a reality for the countries of the Region. Shifting the mindset of policy-makers, health providers and members of the public from one that sees health in terms of combating illness to one mainly focusing on promoting health and well-being is the key to the future. Success requires political support, technical and administrative innovation and changes in how financial resources and other assets are deployed.

The framework for Europe is closely aligned to WHO’s Twelfth General Programme of Work and is a practical expression of a programme of reform in WHO that seeks to enable the Organization to respond to Member State needs more effectively in a rapidly changing world. In the European Region, as in other regions, the outcomes envisaged in this policy framework require that international organizations be able to work not just with selected sectoral ministries but across all relevant parts of government; with colleagues in other international organizations that influence health; as well as with industry, academe and civil society. The policy framework for Europe signals the way forward for new approaches to health and well-being worldwide.

Margaret Chan
WHO Director-General
It gives me great pleasure to welcome you to Health 2020, the European health policy framework for all. Whether you are a president, prime minister, mayor, policy-maker, public health worker or community activist, Health 2020 contains information that can help you make healthier, safer and economically wiser decisions and choices.

Our 21st century health landscape is shaped by growing global, regional, national and local interdependence and an increasingly complex array of interlinking factors that influence health and well-being. We are all challenged, for example, with the task of making sense of and integrating the many different actors and sectoral services (such as housing, water, energy, food and health care) needed to keep ourselves, our families and our populations healthy and happy. We all know that poor health wastes potential, causes despair and suffering and drains resources. Addressing these challenges at any level – personal, institutional, community, municipal or national – requires thoughtful, strategic and coordinated action. All 53 Member States in the WHO European Region have developed and adopted Health 2020 as a guiding framework to support such action.

Health 2020 elaborates a vision of public health as a dynamic network of stakeholders at all levels of society and aims to support action with unity of purpose across the Region. All recommendations in Health 2020 are evidence-informed. Its development has actively involved many experts. Our aim throughout has been to make Health 2020 a unique compilation of the best public health policy evidence available.

Building on an extensive review of published evidence, experiential data and an unprecedented Region-wide participatory stakeholder consultation, the Health 2020 development process has catalysed a broad rethinking of current public health mechanisms, processes, relationships and institutional arrangements. As a consequence of this process, Health 2020 serves as a unique regional resource to help us all learn from experiences acquired in practice, reset priorities and identify better ways to coordinate action amongst stakeholders in all sectors to improve individual and population health and well-being.

Health 2020 acknowledges and celebrates the wide diversity of health systems and approaches across the European Region. It aims not to make national and local health systems uniform but to make them uniformly better. In adopting Health 2020, all countries agreed on two common objectives: the need to improve health for all and reduce the health divide and the need to strengthen leadership and participatory governance for health.

In outlining ways to address these objectives, Health 2020 proposes new forms of governance for health, in which health and well-being are seen as the responsibility of the whole of society and of the whole of government, and encourages active public participation in policy-making.

It addresses the socioeconomic rationale for improving health and makes a strong, evidence-informed case for investment and action through integrated approaches to health promotion, disease prevention and well-being. Actions on social determinants are described that address the development
Health 2020: a European policy framework

of approaches that build health into all policies with the aim of improving the health of everyone and thereby reduce the absolute effect of social determinants on all people as well as targeted interventions that focus on those most affected.

Health 2020 identifies new systems of collaborative leadership to encourage innovative approaches to social mobilization for equitable, sustainable and accountable health development.

Health 2020 details a variety of innovative and effective ways to address today’s complex public health challenges. It outlines a variety of strategies and interventions to address major health challenges across the lifespan related to both noncommunicable and infectious diseases. It shows ways to link clinical interventions with action on equity and social determinants of health and necessary key health system inputs such as human resources and medicines in higher quality, strengthening health funding arrangements and enhancing governance for health.

By articulating a common set of values, evidence and experience, Health 2020 provides a platform for partnership and cooperation. It calls for cross-society engagement as a central part of health policy planning, development, implementation and monitoring at all levels. It makes the case for empowering people, citizens, consumers and patients as a critical factor in improving health outcomes. It argues strongly for the engagement of health professionals.

What will WHO do to help? The Regional Office will support countries in adapting Health 2020 by analysing public health situations; identifying assets; encouraging political commitment from presidents and prime ministers; making policy recommendations and monitoring progress; encouraging leadership and good governance for health; suggesting mechanisms for whole-of-society and whole-of-government approaches; and supporting capacity development.

Two key Health 2020 support documents have been developed. The European policy framework for supporting government and society for health and well-being provides politicians, policy- and decision-makers and practitioners with the main values and action principles needed for putting a Health 2020 approach into practice in their settings. The longer Health 2020 policy framework and strategy provides more detail in terms of evidence and is meant for those who practice policy development and implementation at operational levels.

I believe Health 2020 can add significant value to all of our individual and collective work to enhance health and well-being, serve as unique resource to enhance the future and prosperity of individual countries and the Region as a whole and benefit all its peoples. Actively informing and aligning our daily practice with Health 2020 values and approaches will enable us to build a healthier Europe for ourselves and our children.

Zsuzsanna Jakab
WHO Regional Director for Europe
Health 2020: a European policy framework

Health is a major societal resource and asset

Good health benefits all sectors and the whole of society – making it a valuable resource. Good health is essential for economic and social development and a vital concern to the lives of every single person, all families and communities. Poor health wastes potential, causes despair and drains resources across all sectors. Enabling people to have control over their health and its determinants strengthens communities and improves lives. Without people’s active involvement, many opportunities to promote and protect their health and increase their well-being are lost.

What makes societies prosper and flourish also makes people healthy – policies that recognize this have more impact. Fair access to education, decent work, housing and income all support health. Health contributes to increased productivity, a more efficient workforce, healthier ageing, and less expenditure on sickness and social benefits and fewer lost tax revenues. The health and well-being of the population are best achieved if the whole of government works together to address the social and individual determinants of health. Good health can support economic recovery and development.

Health performance and economic performance are interlinked – improving the health sector’s use of its resources is essential. The health sector is important for both its direct and indirect effects on the economy: it matters not only because of how it affects people’s health and their productivity but because it is now one of the largest economic sectors in every medium- and high-income country. It is a major employer, important landowner, builder and consumer. It is also a major driver of research and innovation and a significant sector in the international competition for people, ideas and products. Its importance will continue to grow and, with it, the significance of its contribution to wider societal goals.

Across the WHO European Region as a whole, health has greatly improved in recent decades – but not everywhere and not for
"Health inequities arise from the societal conditions in which people are born, grow, live, work and age, referred to as social determinants of health."

The participants declared:
"We reaffirm that health inequities within and between countries are politically, socially and economically unacceptable, as well as unfair and largely avoidable, and that the promotion of health equity is essential to sustainable development and to a better quality of life and well-being for all, which in turn can contribute to peace and security."

**What is a social gradient?**

The social gradient in health means that health gets progressively better as the socioeconomic position of people and/or communities improve. Thus health inequities affect everyone. This is a global phenomenon that applies to all countries, irrespective of income.

**Investing in health makes sense**

Of the increase in health spending, 92% correlates with positive growth in gross domestic product (GDP). During the last three decades, health system spending in most countries in the Organisation for Economic Co-operation and Development (OECD) has begun to rise – on average at least 1% per year faster than real GDP across the OECD. In 1950, health spending in the United Kingdom was 3% of GDP. Even in the United States in 1970, health spending was only 7% of GDP. The average health spending in the OECD rose from 5% of GDP in 1970 to 9% in 2010.

**A strong value base: reaching the highest attainable standard of health**

*Health 2020 is based on the values enshrined in the WHO Constitution:*
“The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being”. Countries across the WHO European Region have acknowledged the right to health and committed themselves to universality, solidarity and equal access as the guiding values for organizing and funding their health systems. They aim for the highest attainable level of health regardless of ethnicity, sex, age, social status or ability to pay. These values include fairness, sustainability, quality, transparency, accountability, gender equality, dignity and the right to participate in decision-making.

**A strong social and economic case for improving health**

The challenge health expenditure poses to governments is greater than ever. In many countries, the health share of government budgets is larger than ever, and health care costs have grown faster than GDP. But for at least some of these countries, data show a lack of correlation between health expenditure and health outcome. Many health systems fail to contain costs while financial pressures on them make getting the balance right for health and ensuring social protection ever harder. Costs are primarily driven by the supply side, such as new treatments and technologies, and people's rising expectations of protection from health risks and access to high-quality health care. Before being embarked on, any health reform should give careful consideration to deeply entrenched economic and political interests and social and cultural opposition. These challenges require intersectoral approaches, since health ministers cannot resolve them on their own.

**Real health benefits can be attained at an affordable cost and within resource constraints if effective strategies are adopted.** A growing body of evidence on the economics of disease prevention shows how health costs can be contained, but only if they also address inequalities across the social gradient and support the most vulnerable people. At present, governments spend only a small fraction of their health budgets on promoting health and preventing disease – about 3% in OECD countries – and many do not systematically address inequalities. Social
and technological advances, if used effectively, offer real health benefits, especially in the areas of information, social marketing and social media.

**Using resources efficiently within the health sector can contain costs.** European health systems are being required to improve their performance and respond to new challenges. Reconfiguring services, acquiring new responsibilities, introducing incentives and payment structures can provide better value for money. Health systems, like other sectors, need to adapt and change. Health policy statements by such organizations as the European Union (EU) and the OECD have reinforced this.

*In a globalized world, countries are increasingly required to work together to solve many key health challenges.* This requires cooperation across borders. Many international agreements underline this requirement, such as the International Health Regulations, the WHO Framework Convention on Tobacco Control or the Doha Declaration on the TRIPS Agreement and Public Health (related to intellectual property).

### Strategic objectives of Health 2020: stronger equity and better governance for health

Health 2020 recognizes that successful governments can achieve real improvements in health if they work across government to fulfil two linked strategic objectives:

- improving health for all and reducing health inequalities
- improving leadership and participatory governance for health.

### Improving health for all and reducing health inequalities

Countries, regions and cities setting common objectives and joint investment between health and other sectors can significantly improve health and well-being. Priority areas include: preschool education, educational performance, employment and working conditions, social protection and reducing poverty. Approaches include: addressing community resilience, social inclusion and cohesion; promoting assets for well-being; mainstreaming gender and building the individual and community strengths that protect and promote health, such as individual skills and a sense of belonging. Setting targets for reducing health inequalities can help drive action and is one of the principal ways of assessing health development at all levels.

**Addressing social inequalities contributes significantly to health and well-being.** The causes are complex and deeply rooted across the life course, reinforcing disadvantage and vulnerability. Health 2020 highlights the increasing concern about tackling poor health within countries and across the Region as a whole. The lowest and highest life expectancies at birth in the WHO European Region differ by 16 years, with differences between the life expectancies of men and women; and maternal mortality rates are up to 43 times higher in some countries in the Region than in others. Such extreme health inequalities are also linked to health-related...
Leadership from health ministers and public health agencies will remain vitally important to address the disease burden across the European Region. It needs to be strengthened. The health sector is responsible for: developing and implementing national and subnational health strategies; setting health goals and targets for improving health; assessing how the policies of other sectors affect health; delivering high-quality and effective health care services; and ensuring core public health functions. It also has to consider how its health policy decisions affect other sectors and stakeholders.

Health ministries and public health agencies are increasingly engaged in initiating intersectoral approaches for health and acting as health brokers and advocates. This includes highlighting both the economic, social and political benefits of good health and the adverse effects of ill health and inequalities on every sector, the whole of government and the whole of society. Exercising such a leadership role requires using diplomacy, evidence, argument and persuasion. The health sector also has a partnership role towards other sectors when strengthening health can contribute to achieving their goals. All countries at the United Nations High-level Meeting on the Prevention and Control of Non-communicable Diseases and the World Health Assembly have endorsed such collaborative approaches — referred to as whole-of-government and whole-of-society approaches.

Governments at all levels are considering establishing formal structures and processes that support coherence and intersectoral problem-solving. This can strengthen coordination and address power imbalances between sectors. The strategic benefits of adopting a health in all policies approach are increasingly being recognized. This approach advocates moving health up the policy agenda, strengthening policy dialogue on health and its determinants, and building accountability for health outcomes. Health impact assessment and economic evaluation are valuable tools in assessing the potential effects of policies and can also be used to assess how policies affect equity. Qualitative and quantitative health data can be gathered and validated to assess impact on health.
Research in well-being – as conducted in other organizations such as the OECD – can also contribute.

Governments are also committed to establishing structures and processes that enable increased involvement of a wider range of stakeholders. This is especially important for citizens, civil society organizations and other groups (such as migrants) that make up civil society. Active and committed groups are increasingly coming together to advance health at all levels of governance. Examples range from global to local levels and include: United Nations summits deliberating health; the Inter-Parliamentary Union; the WHO Healthy Cities and Communities movement; global movements to fight poverty; disease-specific advocacy such as HIV; national initiatives to define health targets; and the regional health strategies of entities such as the EU. They play a significant role in promoting health and advancing the health agenda.

Effective leadership throughout society can support better results for health. Research shows strong correlations between responsible governance, new forms of leadership and participation. In the 21st century, many individuals, sectors and organizations can provide leadership for health. This can take many forms and requires creativity and new skills, especially in managing conflicts of interest and finding new ways of tackling intractable complex problems. Together with Member States, WHO has a special responsibility to exercise such leadership and to support health ministries in achieving their goals.

Empowering people, citizens, consumers and patients is critical for improving health outcomes, health system performance and patient satisfaction. The voice of civil society, including individuals and patient organizations, youth organizations and senior citizens is essential to draw attention to health-damaging environments, lifestyles or products and to gaps in the quality and provision of health care. It is also critical for generating new ideas.

Working together on common policy priorities for health

The Health 2020 policy is based on four priority areas for policy action:

- investing in health through a life-course approach and empowering people;
- tackling the Region's major health challenges of noncommunicable and communicable diseases;
- strengthening people-centred health systems, public health capacity and emergency preparedness, surveillance and response; and
- creating resilient communities and supportive environments.

In a spirit of coherence and consistency, the four priority areas build on the "categories for priority-setting and programmes in WHO". Those categories were agreed by Member States at the global level and have been aligned to address the special requirements and experiences of the European Region. They also build on relevant WHO strategies and action plans at regional and global levels.

The four priority areas are interlinked, interdependent and mutually supportive. For example, action on the life course and empowerment of
people will help contain the epidemic of noncommunicable diseases, as will stronger public health capacity. These, in turn, will also help to contain communicable disease outbreaks. Governments achieve higher health impact when they link up policies, investments and services and focus on reducing inequalities. The WHO Regional Office for Europe will step up its role as a resource for developing policy based on evidence and examples of integrated approaches. Regional headline targets will support the monitoring of Health 2020’s progress.

Addressing the four priorities requires a combination of governance approaches that promote health, equity and well-being. Smart governance will anticipate change, foster innovation and be oriented towards investing in promoting health and preventing disease. Approaches to governance will include governing through public policy and regulation as well as new forms of collaboration with civil society organizations, independent agencies and expert bodies. There is an increasing need to apply evidence to policy and practice, observe ethical boundaries, expand transparency, and strengthen accountability in such fields as privacy, risk assessment and health impact assessment.

Health 2020 recognizes that countries engage from different starting-points and have different contexts and capacity. Many health policy decisions have to be taken under conditions of uncertain and imperfect knowledge, and the wider system effects of many aspects of reforming health systems also cannot be fully predicted. Tackling complex problems such as obesity, multimorbidity and neurodegenerative diseases is challenging. Drawing on knowledge from the social, behavioural and policy sciences is proving increasingly important, including social marketing, behavioural economics and neuroscience. Studies note the value of promoting smaller-scale yet comprehensive interventions at the local and community levels, to encourage learning and adaptation. Cooperation across the European Region can accelerate the development of expertise: every country and sector can both learn and contribute.

**Priority area 1. Investing in health through a life-course approach and empowering people**

Supporting good health throughout the life-course leads to increasing healthy life expectancy and a longevity dividend, both of which can yield important economic, societal and individual benefits. The demographic transformation underway in countries requires an effective life-course strategy that gives priority to new approaches to promoting health and preventing disease. Improving health and health equity begins with pregnancy and early child development. Healthy children learn better, healthy adults are more productive, and healthy older people can continue to contribute actively to society. Healthy and active ageing, is a policy priority and a major research priority.

Health promotion programmes based on principles of engagement and empowerment offer real benefits. These include: creating better conditions for health, improving health literacy, supporting independent living and making the healthier choice the easier choice. Furthermore, it means making pregnancies safe; giving people a healthy start in life; promoting safety and well-being and giving protection during childhood
Health 2020 focuses on a set of effective integrated strategies and interventions to address major health challenges across the Region. These are related to both noncommunicable and communicable diseases. Both types require combining determined public health action and health care system interventions. The effectiveness of these is underpinned by actions on equity, social determinants of health, empowerment and supportive environments.

A combination of approaches is required to successfully address the high burden of noncommunicable diseases in the Region. Health 2020 supports the implementation of integrated whole-of-government and whole-of-society approaches that have been agreed in other regional and global strategies, since it is increasingly recognized that action to influence individual behaviour has limited impact. Noncommunicable diseases are unequally distributed within and between countries and are closely linked to action on the social and environmental determinants of health.
Health 2020 supports intensifying efforts to implement global and regional mandates in relation to noncommunicable diseases. The priority action areas for the Region include the following.

- **Existing declarations and strategies.** These include: the United Nations 2011 political declaration on noncommunicable diseases; the WHO Framework Convention on Tobacco Control; the Global Strategy on Diet, Physical Activity and Health; the global strategy to reduce the harmful use of alcohol and regional action plan to reduce the harmful use of alcohol; the action plan for the implementation of the European Strategy for the Prevention and Control of Noncommunicable Diseases 2012–2016; and the WHO Mental Health Action Plan for Europe.

- **Health promotion.** As defined in the Ottawa Charter for Health Promotion, this is at the core of these declarations and strategies. They all encourage governments to develop intersectoral national strategies with goals and targets on key challenges related to noncommunicable diseases.

Health 2020 supports continued strong efforts to combat communicable diseases. No country can afford to relax its vigilance, and each has to continually strive to maintain the highest standards. For the European Region, the priority action areas are as follows.

- **Building information and surveillance capacity:** to implement the International Health Regulations, improve information exchange and, where appropriate, implement joint surveillance and disease control activities by public health, veterinary, food and agriculture authorities to better control infectious diseases that can be transmitted from animals to humans, including emerging infectious diseases, drug-resistant organisms and waterborne and foodborne infections.

- **Tackling serious viral and bacterial threats:** to implement regional policies and action plans; to combat antimicrobial resistance; to contain the emergence and spread of drug-resistant organisms and infections through the prudent use of antibiotics and infection control; to ensure safe basic commodities such as water and food; to reach and maintain recommended immunization coverage to prevent vaccine-preventable diseases; and to reach regional and global eradication and elimination goals for polio, measles, rubella and malaria; to fully control major diseases such as tuberculosis, HIV and influenza by ensuring that the whole population, including vulnerable groups, has access to the health care system and evidence-informed interventions.

**Priority area 3. Strengthening people-centred health systems, public health capacity and emergency preparedness, surveillance and response**

Achieving high-quality care and improved health outcomes requires health systems that are financially viable, fit for purpose, people-centred and evidence-informed. All countries have to adapt to changing demography and patterns of disease, especially mental health challenges, chronic diseases and conditions related to ageing. This requires reorienting health care systems to give priority to disease prevention, foster continual
A health system

“Within the political and institutional framework of each country, a health system is the ensemble of all public and private organizations, institutions and resources mandated to improve or restore health. Health systems encompass both personal and population services, as well as activities to influence the policies and actions of other sectors to address the social, environmental and economic determinants of health.”

–Tallinn Charter: Health Systems for Health and Wealth

Technological and scientific advances

Work on the human genome is substantially changing public health research, policies and practice, and facilitating numerous discoveries on the genomic basis of health and disease. Rapid scientific advances and new genomics tools have contributed to understanding disease mechanisms.

Nanotechnology involves manipulating properties and structures at the nanoscale. It is being used for more targeted drug therapies or smart drugs. These new drug therapies have already been shown to cause fewer side effects and be more effective than traditional therapies.

Technologies for patients and their caregivers such as self-management tools, health applications and devices to better manage their health or their chronic disease from home will contribute to changing the nature of care and reducing costs.

Health 2020: a European policy framework

quality improvement and integrate service delivery, ensure continuity of care, support self-care by patients and relocate care as close to home as is safe and cost-effective. The potential of personalized medicine needs to be assessed.

Health 2020 reconfirms the commitment of WHO and its Member States to ensure universal coverage, including access to high-quality and affordable care and medicines. Many countries have achieved universal coverage but much needs to be done to eliminate catastrophic and impoverishing payments in the Region. It is important to ensure long-term sustainability and resilience to economic cycles, to contain supply-driven cost increases and to eliminate wasteful spending while providing reasonable levels of financial protection. Health technology assessment and quality assurance mechanisms are especially important for health system transparency and accountability and are an integral part of a patient safety culture.

Health 2020 remains committed to a primary health care approach as a cornerstone of health systems in the 21st century. Primary health care can respond to today’s needs by fostering an enabling environment for partnerships to thrive, and encouraging people to participate in new ways in their treatment and take better care of their own health. Making full use of 21st-century tools and innovations such as communications technology – digital records, telemedicine and e-health – and social media can contribute to better and more cost-effective care. Recognizing patients as a resource and as partners, and being accountable for patient outcome are important principles.

Achieving better health outcomes requires substantially strengthening public health functions and capacity. Although public health capacity and resources vary across the Region, prioritizing investment in public health institutional arrangements and capacity-building, and efforts to strengthen health protection, health promotion and disease prevention can have important cost-effective benefits. Reviewing and adapting public health laws and instruments to modernize and strengthen public health functions can also help. Cooperation on global health and health challenges of a cross-border nature is increasingly important, as is coordination within countries that have devolved and decentralized public health responsibilities.

Revitalizing public health and transforming service delivery requires reforming the education and training of health professionals. A more flexible, multi-skilled and team-oriented workforce is at the heart of a health system fit for the 21st century. This includes: team-based delivery of care; new forms of service delivery (including home care and long-term care); skills in supporting patient empowerment and self-care; and enhanced strategic planning, management, working across sectors and leadership capacity. It implies a new working culture that fosters new forms of cooperation between professionals in public health and health care, as well as between health and social services professionals and health and other sectors. The global health workforce crisis requires that the WHO Global Code of Practice for the International Recruitment of Health Personnel be implemented.

Developing adaptive policies, resilient structures and foresight to effectively anticipate and deal with public health emergencies is crucial. It is important for policies to reflect the complexities of causal pathways and respond quickly and innovatively to unpredictable events,
Health 2020: a European policy framework

Public health

The WHO European Region uses the Acheson definition of public health: "the science and art of preventing disease, prolonging life and promoting health through the organized efforts of society". This is achieved through public institutions and collective action. It includes traditional services such as health situation analysis, health surveillance, health promotion, prevention, infectious disease control, environmental protection and sanitation, disaster and health emergency preparedness and response, and occupational health, among others. More recent approaches include social determinants of health, the social gradient in health and governance for health.

20 years of environment and health action in Europe

In 1989, concerned about the growing evidence of the impact of hazardous environments on human health, countries in the European Region together with the WHO Regional Office for Europe initiated the first ever environment and health process, to eliminate the most significant environmental threats to human health.

Progress towards this goal is driven by a series of ministerial conferences held every five years and coordinated by the WHO Regional Office for Europe. The conferences are unique, bringing together different sectors to shape policies and actions on environment and health in the European Region.

Priority area 4. Creating resilient communities and supportive environments

Building resilience is a key factor in protecting and promoting health and well-being at both the individual and community levels. People’s health chances are closely linked to the conditions in which they are born, grow, work and age. Systematically assessing the health effects of a rapidly changing environment – especially related to technology, work, energy production and urbanization – is essential and must be followed by action to ensure positive benefits to health. Resilient communities respond proactively to new or adverse situations, prepare for economic, social and environmental change and deal better with crisis and hardship. The WHO Healthy Cities and Communities movement provides extensive examples on how to build such resilience, particularly by involving local people and generating community ownership of health issues. Other settings-based networks provide similar experiences – such as health-promoting schools or workplaces.

Collaboration between the environmental and health sectors is crucial to protect human health from the risks of a hazardous or contaminated environment and to create health-promoting social and physical settings. Hazards in the environment are a major determinant of health; many health conditions are linked to the environment, such as exposure to air pollution and the impact of climate change, and they interact with social determinants of health. The benefits to health of a low-carbon economy and health co-benefits of environmental policies are being considered in the context of Rio +20, the United Nations Conference on Sustainable Development. Countries have begun to develop policies that benefit both the health of the planet and the health of people and recognize that collaboration between sectors is crucial to protect human health from the risks of a hazardous or contaminated environment.

Expanding interdisciplinary and intersectoral collaboration between human, environmental and animal health enhances public health effectiveness. This can include: working to fully implement multilateral environmental agreements as well as the recommendations of the European environment and health process; expeditiously expanding the scientific knowledge base; assessing the effects on health of policies in various sectors, especially those affecting both health and the environment; ensuring the continual development and adaptation of services for environment and health; and encouraging the health sector to act in an environmentally more responsible manner.

Working together: adding value through partnerships

The aims of Health 2020 will be achieved through a combination of individual and collective efforts. Success requires common purpose and broad collaborative efforts by people and organizations across society in every country: governments, nongovernmental organizations,

<tr>
<td>WHO is in the process of reform, designed to contribute to improved health outcomes and greater coherence in global health to create itself as an organization that pursues excellence, effectiveness, efficiency, responsiveness, transparency and accountability. Overall, the aim is to move from an Organization that delivers separate outputs through a series of technical programmes to an Organization that achieves impact, working with national authorities, through the combined and coordinated efforts of country offices, regional offices, headquarters and its outposts, all operating as part of an interdependent network.</td>

Key to the success of Health 2020 will be Member States and WHO working closely together and reaching out to engage other partners. Close cooperation between the WHO Regional Office for Europe, WHO headquarters and other regions lies at the core. This is supported by building wider engagement across regional networks and entities such as the Commonwealth of Independent States, the Eurasian Economic Community, the countries in south-eastern Europe and the EU.

The WHO Regional Office for Europe will fulfil its constitutional role to act as the directing and coordinating authority on international health work in the European Region. It will establish and maintain effective collaboration with many partners and provide technical assistance to countries. It will work to engage widely; increase policy coherence; contribute to shared policy platforms; share health data sets; join forces for surveillance; and support the development of new types of network- and web-based cooperation. It will act as the European Region’s repository of advice and evidence on what works and will work with countries through new types of country cooperation strategies.

Working with the EU provides a strong foundation, significant opportunities and additional benefits. The 28 EU countries that comprise part of the Region have an integration and cooperation process in health based on the EU health strategy as well as policy frameworks and legal and financial mechanisms to implement them. In addition, EU candidate, potential candidate and European Neighbourhood and Partnership Instrument countries also work to progressively align their legislation and practices with EU policies. This can contribute substantially to implementing Health 2020. The joint declaration of the European Commission and WHO, which includes six roadmaps for greater collaboration, is an important step in strengthening this partnership.

Existing cooperation between WHO and international organizations active in the European Region is also being strengthened. These organizations include bodies such as United Nations agencies, the OECD, the Council of Europe, development agencies and funds and major nongovernmental organizations. Countries across the Region contribute to, and benefit from, cooperation with international organizations, and this represents a valuable resource to support the joint aims of Health 2020 and those of other sectors and organizations.

Linking with new and evolving types of partnerships for health, active at various levels of governance across the Region, will provide important support. Substantial contributions are made by innovative cooperation mechanisms such as the South-eastern Europe Health Network and the Northern Dimension policy; networks such as the WHO European Healthy Cities Network, national health cities networks and Regions for Health; subregional networks within the Commonwealth of Independent States and WHO health promotion settings networks including schools, workplaces, hospitals and prisons throughout the Region.

Working with civil society will strengthen advocacy for implementing Health 2020. Many voluntary and self-help organizations have identified health as a significant part of their remit, and many health services continue to be delivered as part of family and community care and self-care. These organizations act from the local to the global level and have...
Health 2020: a European policy framework

**The vision for Health 2020**

Our vision is for a WHO European Region in which all people are enabled and supported in achieving their full health potential and well-being and in which countries, individually and jointly, work towards reducing inequities in health in the Region and beyond.

**Further information**

A series of studies have been commissioned and reviewed to ensure that all analysis and action proposals in Health 2020 are well grounded in research and experience. These include the following.

- McQueen D et al., eds. *Intersectoral governance for health in all policies*. Copenhagen, WHO Regional Office for Europe, 2012.

significantly shaped the agendas for health and its social determinants. Supporting their contribution is therefore valuable for implementation at all levels.

**Looking for ways to appropriately and ethically engage with the private business sector**. Attitudes towards the private sector in health vary between and within countries. However, businesses are increasingly involved in every aspect of people’s lives. Their influence can help to both enhance health and undermine it. Securing a stronger commitment to health from private sector actors and encouraging and rewarding their social responsibility are important goals.

**Health 2020 – a common purpose and a shared responsibility**

*Health 2020 is an adaptable and practical policy framework*. It provides a unique platform for joint learning and sharing of expertise and experience between countries. It recognizes that every country is unique and will pursue these common goals through different pathways. Countries will use different entry points and approaches but remain united in purpose. Political commitment to this process is essential, and countries have set regional targets to express this.

**In an interdependent world, the need for countries to act together becomes ever more important**. Today, a complex array of global and regional forces challenges people’s health and its determinants. Although more people than ever before now have the chance to attain better health, no country in isolation can harness the potential of innovation and change or resolve the challenges to health and well-being.

The future prosperity of individual countries and the Region as a whole will depend on the willingness and ability to seize new opportunities to enhance the health and well-being of present and future generations. **Health 2020 supports and encourages health ministries to bring key stakeholders together in a shared effort for a healthier European Region.**
HEALTH 2020
A European policy framework supporting action across government and society for health and well-being
